PRIMARY METRICS

Here are 2 primary KPIs based on the baselines provided:

1) Inquiry-to-Order Rate (IOR)

- Metric name: Inquiry-to-Order Rate (IOR)
- Definition: Percentage of inquiries that convert into confirmed orders.
- Current baseline: 18.000%
- Target: Not specified in the data provided.
- Direction: Higher is better.
- Why it's the north-star:
 - Directly measures conversion efficiency from demand (inquiries) to revenue-generating orders.
 - Small changes in IOR have a leveraged impact on total revenue, given the existing inquiry volume.
 - Aligns sales, marketing, and operations around a single conversion outcome.

2) Average Order Value (AOV)

- Metric name: Average Order Value (AOV)
- Definition: Average revenue per order.
- Current baseline: \$4,000
- Target: Not specified in the data provided.
- Direction: Higher is better.
- Why it's the north-star:
 - Captures the revenue quality of each converted order.
 - Provides a clear lever for pricing, packaging, and upsell/cross-sell strategies.
 - When combined with IOR, defines total revenue performance: more orders (IOR) at higher value (AOV).

SECONDARY METRICS

Data is insufficient to answer.

No primary metric, context, or baseline values were provided, so I cannot define meaningful secondary metrics, baselines, or targets without inventing numbers or assumptions.

GUARDRAIL METRICS

Data is missing, so I'll propose generic guardrail metrics that are commonly used across experiments. You should replace these with product-specific numbers once available.

1. Critical bug / incident rate

- Metric: Number of P0/P1 incidents attributable to the experiment per day
- Threshold: > 0 P0 incidents in any day, or > 1 P1 incident in any rolling 7-day window
- Action: Immediately stop the experiment and roll back

2. User complaint / support ticket spike

- Metric: Incremental increase in support tickets clearly linked to the experiment
- Threshold: > 20% increase vs. pre-experiment baseline for 3 consecutive days
- Action: Pause the experiment and investigate root cause

3. Data / logging integrity

- Metric: Percentage of events successfully logged for the experiment cohort
- Threshold: < 95% of expected events captured for 2 consecutive days
- Action: Stop the experiment; do not make decisions on incomplete data

These are structural guardrails; they do not rely on product-specific performance metrics, which are not provided.

DATA TRACKING REQUIREMENTS

Data is insufficient to answer.

No product, feature, or user journey has been described, and there are no existing events or metrics provided. Without that, I cannot define specific event names, triggers, or properties in a way that is grounded in actual data.

To proceed, I need at minimum:

- A description of the product or feature to be instrumented
- The key user actions or flows to be measured (e.g., signup, search, purchase)
- The primary KPIs for MVP (e.g., activation rate, conversion rate, feature adoption)

Once provided, I can list events in the requested format:

Track: event_name | Trigger: description of when it fires | Properties: specific fields to capture | Owner: team/role responsible

OPEN QUESTIONS & ASSUMPTIONS

1. Target customer and use case

- Open question: Who is the primary user segment and what specific problem does this product solve for them?
- Assumption: There is a clearly defined, underserved need that this product addresses better than existing alternatives.

2. Value proposition and differentiation

- Open question: What are the top 2–3 benefits customers will pay for, and how do they compare to current solutions?
- Assumption: The product's feature set and pricing create a compelling, defensible advantage versus competitors.

3. Demand and willingness to pay

- Open question: What is the expected adoption rate and what price points will the target segment accept?
- Assumption: There is sufficient demand at the planned price to achieve the required revenue and margin targets.

4. Operational and technical feasibility

- Open question: Can we reliably deliver the planned functionality, performance, and support with current resources and timelines?
- Assumption: Existing technology, teams, and processes can scale to meet expected usage without major service or quality issues.

5. Risk, compliance, and go-to-market readiness

- Open question: Are there regulatory, legal, or brand risks, and is the sales/marketing organization ready to position and support the product?
- Assumption: No blocking compliance issues exist, and commercial teams can effectively drive awareness, adoption, and retention at launch.
